Summary of Academic Productivity:

**Calabrese Scopus-based assessment 4/10/13: H index 70**
Of Dr. Calabrese’s published papers, only 321 were available because Scopus only has access to documents published after 1996. The total number of citations of Dr. Calabrese’s body of scientific work between 1996 and 2012 are 18,994. These 321 publications have been cited 18,994 times by 8,031 other publications between 1998 - 2013. 26 publications have been cited more than 200 times. 70 publications have been cited at least 70 times, which generates an H index of 63. The H index is a metric which focuses on the average number of citations per publication in highly cited publications. It is viewed as a metric of lifetime citedness because it combines productivity and citation impact: the highest integer $h$ such that $h$ among this person’s papers has collected at least $h$ citations.

**Calabrese Web of Knowledge-based assessment 4/30/13: H index 62**
Dr. Calabrese has 401 published scientific manuscripts, which have been cited 15,288 times, an average of 38.12, generating an H-index of 62. When examining articles specifically focusing on his primary focus, bipolar disorder, he has 282 articles, which have been cited 12,927, an average of 45.84, generating an H-index of 60.

**Calabrese G-Index 12/12/12: G index 70:**
- The G-index is believed to be superior to the H index in that the weighting of citations received is considered and that for a given scientist, it is not limited by his/her total number of publications. Selective scientists who publish less are not disadvantaged by the G-index.
